Preparing for Installation

Tools and Materials Needed

1. Phillips screwdriver (size 0 or 1)
2. Torx screwdriver set (T8, T10, T12)
3. Anti static wrist strap (optional but recommended)
4. Thread locking compound (for added security)
5. Cleaning cloth and compressed air for dust removal
6. Manufacturer's mounting kit (included with the Air Top 2000 /S)

Safety Precautions

Before you begin, take a moment to ensure your workspace is safe:

- Power down: Turn off the PC and unplug all cables.
- Static protection: Wear an anti static wrist strap or frequently touch a grounded metal object to discharge static

electricity.

- Ventilation: Work in a well ventilated area to avoid inhaling dust.
- Handle with care: The fin stack is delicate; avoid bending or flexing it during installation.

Step by Step Assembly Instructions

Step 1: Unpacking and Inspection

Carefully remove the Air Top 2000 S from its packaging. Verify that all components are present: the cooler body, mounting brackets, screws, fan, and the mounting kit. Inspect each part for scratches, bent pins, or missing screws. If you notice any damage, contact Ecovippari's support before proceeding.

Step 2: Selecting the Correct Mounting Bracket

The Air Top 2000 S comes with a selection of brackets tailored to different motherboard form factors. Identify your motherboard type (ATX, Micro ATX, Mini ITX) and choose the corresponding bracket. This ensures a secure fit and prevents strain on the motherboard's I/O shield.

Step 3: Attaching the Mounting Bracket to the Cooler

Align the bracket's mounting holes with the pre drilled holes on the cooler's base. Using the supplied Torx screws, secure the bracket firmly. Apply a light amount of thread locking compound to each screw head to prevent loosening during operation. Tighten screws in a cross pattern to distribute pressure evenly.

Step 4: Positioning the Cooler on the Motherboard

Place the cooler onto the CPU socket, ensuring the heat spreader aligns perfectly with the processor. If your CPU has a large integrated heat spread, you may need to use an additional spacer. The bracket's design should allow the cooler to rest flush against the socket without forcing.

Step 5: Securing the Cooler to the Motherboard

Attach the mounting screws that connect the bracket to the motherboard. Start from the center and work outward, again using a cross pattern. Tighten each screw just enough to hold the cooler in place without over screwing, which could damage the motherboard or the cooler's mounting plate.

Step 6: Connecting the Fan Power Cable

The fan's power cable plugs into the dedicated CPU fan header on your motherboard. Locate the header, usually labeled **CPU_FAN** or **CPU_FAN1**. Insert the connector, ensuring it's fully seated. If your motherboard has multiple headers, refer to the manual for the correct one.

Step 7: Attaching the Fan to the Cooler

Slide the fan onto the mounting rail at the rear of the cooler. The fan's screw holes should line up with the rail's pre drilled slots. Secure the fan with the supplied screws, again tightening in a cross pattern to ensure even pressure. Some models feature a quick release mechanism; if yours does, lock it in place to keep the fan firmly attached.

Step 8: Routing the Power Cable

Run the fan cable along the back of the cooler, using cable ties or Velcro straps to keep it tidy and prevent interference with other components. Avoid placing the cable near moving parts or heat intensive areas, which could cause wear.

Step 9: Final Alignment Check

Double check that the cooler sits level on the CPU socket and that the fan is centered. Verify that all screws are tightened to the specified torque (usually 1.2–1.5 Nm, but check the manual for exact values). Ensure that no cables are pinched or twisted.

Step 10: Final Checks and Testing

Reconnect your PC, power it on, and enter the BIOS or UEFI to verify that the fan is spinning. Check the temperature readings to confirm that the cooler is functioning correctly. If the fan does not spin or temperatures are unexpectedly high, re inspect the fan connection and ensure all screws are properly tightened.

Common Issues and Troubleshooting

Even with careful installation, some problems can arise. Below are common issues and how to resolve them.

- Fan not spinning: Check the power cable connection, ensure the header is enabled in BIOS, and confirm that the fan's speed controller is set to the correct mode.
- Unbalanced cooler: Verify that all mounting screws are tightened evenly. An uneven cooler can cause uneven pressure on the CPU.
- High temperatures: Make sure the heatsink is properly seated and that the thermal paste was applied correctly. Reapply paste if necessary.
- Noise: Adjust the fan speed in BIOS or use Ecovippari's software to fine tune the fan curve. Ensure the fan is not obstructed by cables.
- Vibrations: Tighten all screws and double check that the fan is securely attached to the mounting rail.

Maintenance and Care Tips

Proper maintenance extends the life of your Air Top 2000 /S and keeps it running efficiently.

- Regular cleaning: Every 3–6 months, remove the cooler from the CPU, disassemble, and gently clean the fins with compressed air or a soft brush.
- Check for dust accumulation: Inspect the fan blades and the heat spreader for dust. Clean as needed to maintain airflow.
- Inspect screws: Periodically check that all mounting screws remain tight. Use a torque wrench if available to maintain the correct torque.
- Thermal paste replacement: Replace the thermal paste every 12–18 months or if you notice a temperature rise.
- Avoid over tightening: Over tightening can damage the bracket or the motherboard. Stick to the manufacturer's recommended torque.

Frequently Asked Questions

1. What is the recommended thermal paste for the Air Top 2000 /S? Ecovippari recommends using a high performance paste such as Arctic MX Pro or Noctua NT H4 for optimal thermal conductivity.
2. Can I use the cooler with a water cooling loop? The Air Top 2000 /S is designed as an air cooler; it is not compatible with water cooling setups. However, you can use it in conjunction with a separate water block for the GPU if your case allows.
