1. Financial Statements and Analysis

This section introduces the balance sheet, income statement, and cash flow statement. It explains how to interpret financial ratios, assess liquidity, profitability, and leverage, and use these metrics to make informed decisions.

2. Time Value of Money

Fundamental to all financial calculations, this chapter covers present and future value, annuities, perpetuities, and discount rates. It also provides practice problems that reinforce the concept.

Case Study Spotlight: A Real World Application

Consider a mid size manufacturing firm evaluating a new production line. The firm must decide whether to finance the project through debt, equity, or a mix.

Using the textbook's framework, the firm:

- Calculates the NPV of the project using projected cash flows and a discount rate derived from its WACC.
- Assesses the cost of debt (current interest rates) and the cost of equity (market risk premium).
- Analyzes the impact on leverage ratios and how the decision aligns with the firm's risk tolerance.
- Considers dividend policy implications—whether to retain earnings or issue new shares.

- Projects future financial statements to evaluate liquidity and solvency post investment.

Through this systematic approach, the firm can make an informed financing decision that balances risk and return.
